Press Release

Model 1400 Economical Top Labeling System

LSI recently supplied a top labeling system to a major computer software manufacturer. The machine is designed to be versatile so as to apply labels on the top or various sized packages. Change over is accomplished without the use of tools. The LSI microprocessor circuit allows for label placement to be changed in the direction of travel without moving the product sensor.

The system utilizes solid construction techniques including aluminum plate box for the labeling head and Thompson shafting on the head mounting system. The machine can be equipped with either a belt type or delrin chain-type conveyor and is capable of operational speeds up to 80 products per min.
